EXPERIENCE

Arch Jun. 2025 - Present
Software Engineer

- Build and maintain portal integrations using browser automation (Selenium, CDP) and HTTP clients (Axios) within Arch's document-ingestion pipeline, which retrieves 100,000+ fund documents/day (85% of intake) from 300+ investment-manager portals; co-developed an LLM-driven agentic web scraper and built its React prompt and configuration management UI.
- Develop and maintain a full-stack platform that ingests newly onboarded funds' historical documents in bulk through LLM classification, extraction, and validation; improved reliability and accuracy by building reconciliation tools, custom processing rules, and bulk operations.
- Designed and built the source-of-truth system for how 10,000+ funds report (expected documents, cadence, activity types), powering automated document-intake population, data-quality checks, and alerting across internal systems; includes the schema, backend, and a React self-serve UI.
- Built the React interface that lets operations customize LLM extraction and classification at the investment, issuing-entity, or firm level without code changes; used across the parsing platform and supporting 90%+ accuracy.
- Diagnosed and resolved performance bottlenecks across frontend rendering, database queries, and request handling, cutting page load times by up to 40% through profiling-driven React memoization, query optimization, and bulk and parallelized operations; introduced indexes and trigger-maintained aggregate columns to remove repeated computation from frequently executed queries.

AECOM Tishman Aug. 2024 - May 2025
Senior Software Engineer (Full-Time Contract)

- Built a Python-based data extraction system using Jinja2, Pyppeteer, openpyxl, and REST APIs to automate extraction of 300+ GB of project document data per project from Procore.
- Developed an automated reporting pipeline using Python, pandas, NumPy, Azure Functions, and Power Automate to generate and distribute weekly reports containing key project financial metrics.
- Improved system API performance by 70%+ through parallel processing and data caching, while optimizing SQL queries to eliminate unnecessary database operations and reduce infrastructure costs by 20%+.

Port Authority of NY NJ Feb. 2023 – Aug. 2024
Full Stack Software Engineer (Full-Time Contract)

- Migrated a legacy .NET Core backend from v3.1 to .NET 8, resolving 150+ compatibility issues, improving system load times by 30%+, and upgrading security protocols to modern standards.
- Built an ERP system for job management and budget reporting using SPFx and TypeScript, automating job tracking and reporting and increasing job allocation efficiency by 15%+.

TECHNICAL SKILLS

Programming Languages: JavaScript, TypeScript, Python, C#, Ruby, SQL, HTML, CSS

Frameworks & Libraries: React, Angular, Next.js, .NET, Ruby on Rails, Node.js, Express.js, Django, Redux, Tailwind

Technologies: AWS, Azure, REST APIs, CI/CD, DuckDB, Git, MySQL, PostgreSQL, MongoDB, Selenium, Pandas, NumPy

PROJECTS

hanchen.dev – web-responsive portfolio site – Next.js, TypeScript, Tailwind, Framer Motion
